

# Triangle

Triangles convey direction, stability and hierarchy, turning abstract relationships into instantly recognizable visual cues that draw attention to structure or changing trends. Applications include—but are not limited to—the following:

## Up / Down Arrows

Displays cumulative values across multiple categories, clearly showing each part's contribution and the overall total. Common examples include departmental performance across quarters or cumulative component ratios in samples.

## Directional Arrows

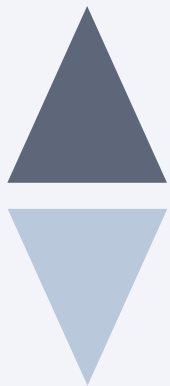

Offers a straightforward comparison of numerical values between different categories, such as sales by product or department performance. Bar height represents value differences clearly.

## Pyramid Chart

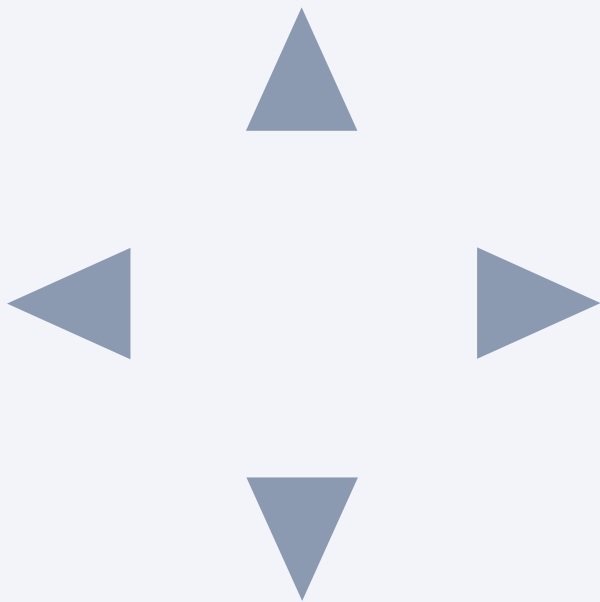

Depicts top-down hierarchy or relative importance, using areas that decrease progressively from base to apex.
