

# Rectangle

Rectangles are core visual elements used to represent various types of data and can dynamically adapt based on information needs.

## Stacked Bar Chart

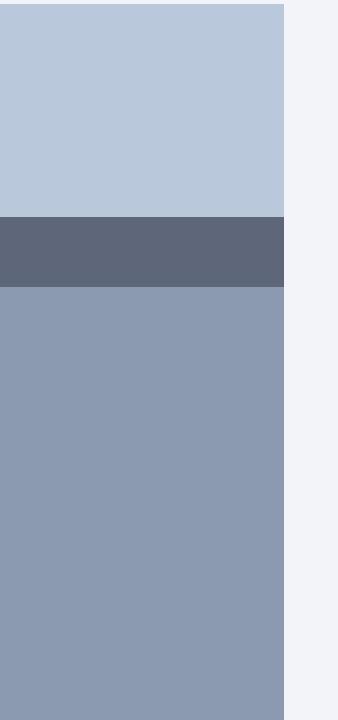

Displays cumulative values across multiple categories, clearly showing each part's contribution and the overall total. Common examples include departmental performance across quarters or cumulative component ratios in samples.

## Bar Chart

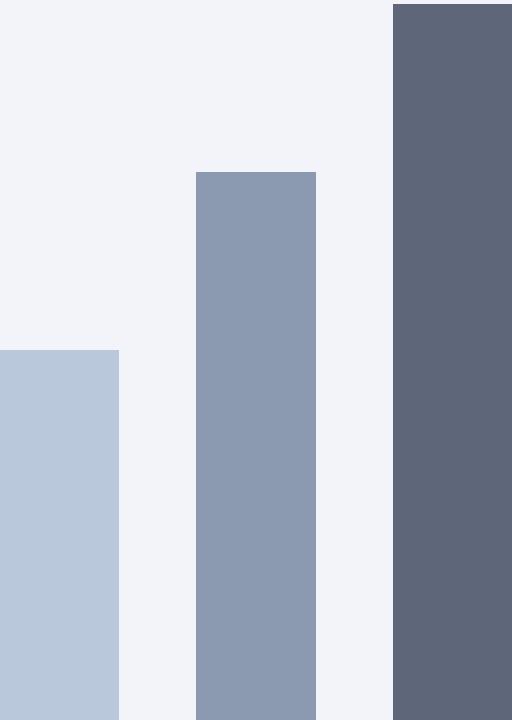

Offers a straightforward comparison of numerical values between different categories, such as sales by product or department performance. Bar height represents value differences clearly.

## Bento Chart

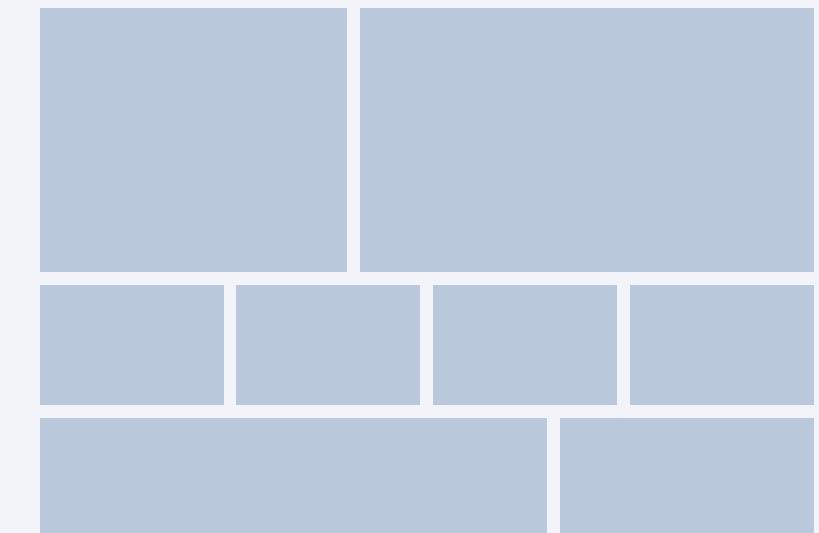

Presents multiple related data groups compactly within a single visual frame. Inspired by the divided structure of Japanese bento boxes, this grid-based layout breaks down complex data into modular blocks, enabling efficient, multi-dimensional information display.
